ODF, also known as optical distribution frame or fiber optic patch panel, is a critical device used in optical communication for managing and distributing optical fibers. It is usually a compact and structured framework composed of a steel shell and internal fiber splice tray as the. In modern data centers and enterprise networks, Optical Distribution Frames (ODF) serve as the backbone for organizing, terminating, and managing fiber optic connections. As data centers, enterprises, telecom operators, and smart-building infrastructures deploy increasingly dense fiber links, ODFs provide the structured. As fiber optic infrastructure expands to meet the demands of cloud computing, streaming, and high-speed connectivity, managing the sheer volume of cables has become a complex challenge. They provide efficient fiber optic management, connectivity, and protection.
